1. 下载 https://github.com/allegro/php-protobuf/
2. 去掉AYangMobads_API_*.proto里的;号
3. 根据AYangMobads_API_*.proto生成proto_api文件
4. 增加parseMobadsString函数

```php
function parseMobadsString($string) {
        $mobadsResponse = new Mobads_Apiv5_MobadsResponse();
        if ($mobadsResponse ->parseFromString($string)) {
                if ($mobadsResponse ->getErrorCode()){
                        echo 'Error'. $ mobadsResponse ->getErrorCode() . "\n";
                        return false;
                }
                $Ads = $ mobadsResponse ->getAds();
                if (!$Ads) {
                        echo 'Error' . 'no match ad' . "\n";
                        return false;
                }
                $Ad = $Ads[0];
                $meta = $Ad->getMaterialMeta();
                $data = array();
                $data['count_off'] = $meta->getWinNoticeUrl();
                $data['title'] = $meta->getTitle();
                $data['meta'] = $meta->getMediaUrl();
                $data['click'] = $meta->getClickUrl();
                echo "Baidu_Ad_Info\n";
                print_r($data);
        }else{
                echo '解析失败';
                return false;
        }
}
```

5.通过proto_api提供的函数生成协议
6.使用 parseMobadsString 处理返回数据
